Shared dCST framework

Retained feature family + depth-wise dominance-lineage recursion
Absorb-policy labels separate state construction from downstream inference

Gut IBD portability

AGP-derived shared-taxonomy states transferred and rebuilt in external IBD cohorts
Signal is clinically coherent in Halfvarson but attenuates under subject-aware sensitivity

CT functional interpretation

Full-VOG states associate with clearance and persistence
Capped VOG robustness and functional follow-up support panel-level organization

Cross-application synthesis

Deterministic dominance-lineages provide a reusable microbiome state representation.
Portability, robustness, and biological interpretability remain application-dependent empirical properties.
